

Regional Sectorial Outlook

Mexico

Second Half 2014 Economic Analysis

- National economic growth accelerates in 2014, but sector disparities still prevail
- All country regions will very likely show better economic performance in 2014 vs. 2013
- The Mexican Oil Fund is unlikely to accumulate resources immediately
- The automotive industry in Mexico has become a significant export platform worldwide
- Consolidation of economic growth is necessary for domestic tourism to grow at a similar rate to international tourism

1. In Summary

Economic activity recovers in the first half of the year and sector disparity will be vanishing

Across-the-board growth in manufacturing will occur as long as external demand (particularly of non-automotive goods) grows faster, and provided that domestic consumption shows more dynamism. Within the service sector, the activities more associated with external demand than internal -such as trade, transport and mass media- are improving substantially, while those more linked to the domestic market (except tourism services for foreign visitors), are showing moderate annual growth rates .

By the second half of 2014, we expect the Mexican economy as a whole to grow at an average annual rate of 3.2%, seasonally adjusted, with which our growth rate forecast of 2.5% would be reached by the end of the year. If this is the case, it will mean getting off to a good start in 2015 and we could be a little more optimistic. Our forecast for GDP growth in 2015 is 3.5%. If include the fact that structural reforms have been approved, the construction sector has yet to strengthen itself, domestic demand needs to invigorate itself and low consumer and producer confidence must be overcome.

All country regions will show higher economic growth in 2014 vs. 2013

The national economic growth forecast for 2014 is 2.5%, a higher figure than in the year before. In all five regions into which we have divided the country according to their economic vocation, we forecast that their economies will outperform the 2013 results. In particular, the following expectations for 2014 stand out: i) the foreseen acceleration of economic growth in the Medium Development region will be a determining factor for the GDP's better expected performance; ii) the Touristic region is expected to continue posting the highest economic growth; and iii) greater economic momentum in the Medium Development and Industrial regions will account for 73% of the expected acceleration in national economic growth over the year before.

As has been the case since 2011, an interregional comparison among the estimated economic growth rates for 2014 indicates that the Touristic region will be the most dynamic. This economy is expected to grow by 3.9%, while the Industrial, Medium Development and Low Development regions will probably post growth rates of 3.0%, 2.1%, 2.0% and 1.8%, respectively.

A regional incidence analysis of 2014's national economic growth forecast allows us to identify the Medium Development and Industrial regions as those making the biggest additions to the country's improved economic performance over 2013. Although most of the regions will likely make larger contributions to expected national economic growth in 2014 vs. 2013, the Medium Development region stands out because of the recovery of its contribution to such growth. The addition by this region is estimated at 0.7pp in 2014 vs. 0.0pp in the year before. We should mention that this region contributed, on average, 1.0pp during the years of national economic expansion between 2004 and 2012.

¹ There is a detailed description, in Spanish, of the classification in *Situación Sectorial Regional México*, "Agrupamiento Regional, Cómo y Para Qué", November 2007. BBVA Bancomer. Regions are divided by economic vocation and level of development: Highly Development: DF; Touristic: BCS and QR; Industrial: Ags, BC, Coah, Chih, Jal, Méx, NL, Qro, Son, Tamps; Medium Development: Camp, Col, Dgo, Gto, Hgo, Mich, Mor, Nay, Pue, SLP, Sin, Tab, Tlax, Ver, Yuc, Zac; Low Development: Chis, Gro and Oax.

Special reports: general implications of some secondary energy laws, Mexico's consolidation as a powerful automotive exporter and the progress made by domestic and international tourism at a two-speed fashion

This edition of *Mexico Regional Sectorial Outlook* shows three analysis of the following topics: i) some of the secondary energy laws decreed by the Federal Executive; ii) the automotive industry and the relevance of its export platform for the Mexican economy; and iii) domestic and international tourism in Mexico with a focus on the factors that have influenced its recent performance.

The main findings of the analysis of some of the secondary energy laws are as follows: i) Pemex will continue to be a major contributor to public revenues through the annual payments for the rights to shared profits; ii) the State's new companies for profits, Pemex and CFE, could become more competitive at the expense of a higher public debt to GDP ratio and the likely higher costs of borrowing for the federal government; iii) the Mexican Oil Fund is unlikely to start accumulating resources immediately, due to the continuation of the practice of using most of the revenue from oil rights to meet the needs of the Federation's Expenditure Budget; and iv) the success of the electricity industry's restructuring to a large degree will hinge on having both enough competitors on the generation side and an efficiently managed and regulated transmission network.

As for the automotive industry, this document looks at the extraordinary growth that Mexico has experienced since the restructuring of the North American industry in 2007. This expansion is expected to continue at even greater speeds, with positive impacts on investment (new assembly and input supplying plants) and employment. Behind these figures is the global trend of outsourcing production from developed countries to emerging markets. In the context of emerging economies, Mexico has become one of the most profitable exporters in the world, with high quality at lower costs, competing for the carmaker supremacy with other NAFTA (North American Free Trade Agreement) partners, especially with the US.

Up until the first half of 2014, tourism in Mexico continued to grow, not only in higher FX revenues, but also in average expenditure and hotel occupancy levels. Both destinations focusing on international tourism and occupancy in large urban conglomerates are expanding. Meanwhile, places visited mainly by domestic tourists and medium-sized and border towns could do better, in the light of greater economic growth expected for the second half of this year. Beach tourism has performed satisfactorily over the year and we expect occupancy levels to continue their improvement, helped above all by demand from international visitors. The business niche is growing strongly, as are occupancy levels in Mexico City and the Bajio area. We foresee that the differences between tourism destinations will persist as long as the economic growth does not consolidate.

2. Regional and Sectorial Analysis

2.a The recovery of economic activity in 1H14 keeps going; disparities among sectors will dissipate as growth consolidates

After four quarters of slow economic growth, this indicator accelerated in 2Q14 (2.7% vs. 0.7% in 1Q14 at an annual rate, seasonally adjusted (sa)). By the end of 1H14, the economy grew 1.7% y/y. The fastest acceleration in growth was in commerce (from 0.2% to 3.8% y/y) followed by manufacturing (from 2.8% to 4.0% y/y). Construction continues to show the greatest lag, as it has done so since late 2012 (see Chart 2a.1).

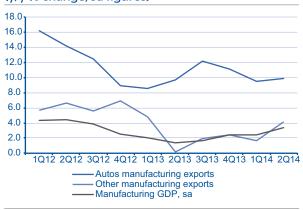

Chart 2a1

Gross Domestic Product (GDP) in Mexico
(y/y % change, sa figures)

Source: BBVA Research with data from INEGI

Chart 2a.2 GDP and manufactured exports (y/y % change, sa figures)

Source: BBVA Research with data from INEGI

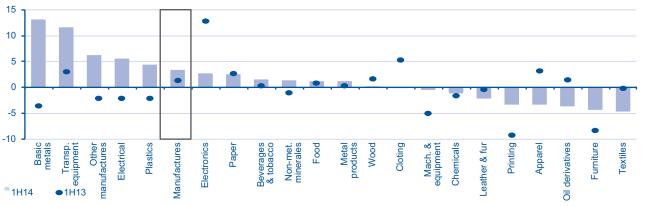

Industrial activity, ups and downs continue in the first half of 2014

In manufacturing, the modest growth in non-automotive exports (whose relative weight is approximately two-thirds of the sector's external sales) has limited the overall sector's growth (see Chart 2a.2). In 1H14 such exports rose 3.4%, a higher figure than the 1.3% recorded in 1H13. Thus, the sectors linked to the automotive industry show the highest rates of growth, when compared with a year before, too: transport equipment (11.6% vs 3% in 1H13); basic metal industries (13.1% vs. -3.6%); electrical equipment (5.6% vs. -2.1%) and the plastic and rubber industry (4.4% vs -1.9%). At the other extreme, there were contractions throughout the entire chain in textiles/garment-making; furniture making; machinery and equipment; the chemicals industry; and oil and coal by-products. The sectors posting medium growth (similar to the average expansion of manufacturing) will be food and beverages; ITC equipment; paper; and non-metal minerals. For growth to be widespread, it is crucial that external demand (particularly non-automotive goods) should grow at a higher rate, and that this should go hand-in-hand with noticeable momentum in domestic consumption.

Chart 2a.3

Manufacturing production

(First half of the year y/y % change, figures seasonally adjusted)

Source: BBVA Research with data from INEGI

Opportunities are opening up for oil extraction activities. Slowly but surely, the mature wells are becoming exhausted and production is showing a downward trend, which will be hard to reverse unless new fields are added. Now that the energy reform has been approved, there is an opportunity to increase production and expand capacity in refining, petrochemicals and gas extraction. At the end of the first half of 2014, mining production continued to fall (-1.9% vs -0.3% in 1H13), mainly as a result of the lower volumes of oil extraction.

Although production in the electricity sector adjusts either upwards or downwards depending on the phase of the economic cycle, demand for energy has a positive trend, making the need to expand capacity in the long term persist. Therefore, both the state-owned electric company (CFE, for its acronym in Spanish) and independent producers need to build efficient plants with cleaner technologies to cope with the expected growth in demand.

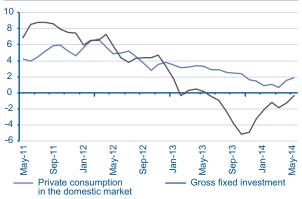

Although construction still showed a -3.2% rate in annual terms in 1H14, there are good reasons to expect that in the future it will contribute to economic growth. Public investment is already starting to be noticeable, and with implementation of the secondary legislation of the telecommunications and energy reforms, construction will be given renewed momentum.

Modest growth in the services sector reflects a sluggish private consumption

Given the current performance of manufacturing, there is no doubt that the external environment has improved, which is driving growth. Now what we need is more progress on the domestic economy front. Household consumption and private investment have shown little momentum, with business and consumer confidence still low. Similarly, the jobs created have mainly been of the low-paying type. All of the aforementioned renders a services sector with internal contrasts. On average, this sector showed an encouraging 2Q14, with an annual growth rate of 2.8%, up from 1.0% in 1Q14. Since the first three months of the year were influenced by the adverse short-term effects of the tax reform, growth in 1H14 was withheld from getting higher (1.9% vs 2.8% from a year before). This rate is still insufficient and ought to be more dynamic in the following months.

Chart 2a.4

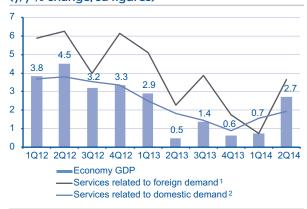

Consumption and investment
(y/y % change 3mma, sa figures)

Source: BBVA Research with data from INEGI

Chart 2a.5

Services production
(y/y % change, sa figures)

 $1\,\mbox{lncludes}$ sectors such as trade, transport, post and storage; and information from the mass media.

2 Includes the remaining tertiary activities Source: BBVA Research with data from INEGI

Services activities that are more associated with external than domestic demand -such as trade, transport and the media- improved significantly in 2Q14, as a group growing 3.6% y/y vs. 0.7% in 1Q14 sa, bringing the accumulated growth in 1H14 to 2.2% vs. 3.7% in 1H13. This proves that the recovery of exports has already permeated through the services sector.

Despite greater momentum in economic activity, the activities of services that are more closely linked to the domestic economy (except for tourism driven by foreign visitors), although showing positive annual rates of growth, they are still very modest: 1.5% in 1Q14 and 1.9% in 2Q14. This is a consequence of modest growth in the real salary mass derived from a higher proportion of low-wage formal employment. Undoubtedly, increased taxation has also been an important factor for consumption dynamics.

Chart 2a6
Activities of the services sector
(y/y % change, seasonally adjusted figures)

Source: BBVA Research with data from INEGI

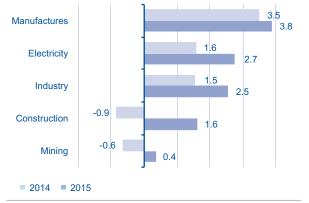

By the second half of 2014, disparities in the Mexican economy will be less, which will make possible to grow 3.5% in 2015

Growth will continue in the global environment, estimated at 3.3% by the end of 2014, and 3.8% in 2015, but recovery will be slower than on other occasions. This will imply improvements in advanced economies, the US (2.0% and 2.5% in 2014 and 2015, respectively) and the eurozone, and a soft landing in China.

For 2H14 the Mexican economy as a whole is expected to march at an annual rate of 3.2% sa, which would bring the annual growth rate to 2.5%. If this were to happen, it would mean that 2015 would get off to a good start and we could be a little more optimistic about expecting a better rate of expansion. If we add to this mix the fact that secondary laws have been approved, it will only be necessary to consolidate the construction sector, pep up domestic demand and overcome low consumer and producer confidence indicators.

While we believe that the automotive industry's exports will continue to contribute most to growth in manufacturing, with the recovery of domestic consumption and non-automotive exports, we can expect it to grow by 3.5% in 2014 and 3.9% in 2015. Within manufacturing, progress will be more even among sectors, with all of them growing by 2015. The most modest progress will be in the textile and clothing chain and in oil by-products. Meanwhile, the biggest progress will come from those sectors linked to external markets and from public construction as well as.

Chart 2a.7 Industrial production, growth 2014-15 (y/y % change)

Source: BBVA Research with data from INEGI

Chart 2a.8

Manufacturing growth 2014-15

(y/y % change)

Source: BBVA Research with data from INEGI

The investment outlook for the second half of the year is positive; we estimate growth of 4.1% in 2H14 vs. -1.8% in 1Q14 for total investment, meaning that 2O15 will start with increasing momentum, reaching 6.1% by year-end. Public spending on infrastructure will allow private investment to be propped up (including investment by PEMEX). For the oil industry, authorities estimate production volumes of 2,350 mbbls/d in 2O14 and 2,400 mbbls/d in 2O15, in which case extractive industries as a whole would grow -0.6% and 0.4%, respectively.

In services, those activities most closely linked to the external sector will be leading growth: mass media, transport and commerce. In the rest of services, which are more related to the domestic market, although we expect better performance, higher growth will be conditional on better progress in the growth rate of the real salary mass, and on a substantial improvement in the quality of jobs created, as well as on a boost to consumer confidence.

- $2\,\mbox{The rest:}$ services more linked to domestic demand
- Source: BBVA Research with data from INEGI

In summary

The economic momentum of 2014-15 assumes that the impact of reforms will still be limited; in particular, the impulse from the telecoms and energy reforms. At the same time, the need to define the sectors in which Mexico has competitive advantages, both on a local level and over other countries, has become again a very relevant issue. Up to now, the scorecard for economic growth contains pluses and minuses. The economic activity accelerated in the second guarter, although not at its potential rate.

2.c We foresee that all regions will show higher economic growth in 2014 vs. 2013

The country's forecasted economic growth as a whole for 2014 is 2.5%, higher than the year before. In all five regions into which we have divided the country by their economic vocation, their economy is expected to perform better than in 2013.1 We find the following expectations for 2014 particularly significant: i) the foreseen acceleration for economic growth in the Medium Development region will be a key factor to the expected improvement in national GDP performance; ii) the Touristic region is expected to continue being the region with the highest economic growth; and iii) the greater economic momentum in the Medium Development and Industrial regions will account for 73% of the acceleration expected in the country's economic growth over last year's.

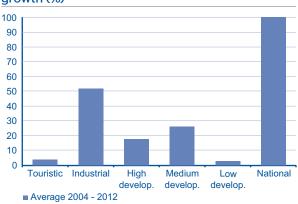

As has been the case since 2011, when we compare among regions the economic growth estimates for 2014, the greatest momentum is to be found in the Touristic region. This economy is projected to grow by 3.9%, while the Industial, Medium Development, High Development and Low Development regions will probably post growth rates of 3.0%, 2.1%, 2.0% and 1.8%, respectively (see Chart 2c.1).

Regional contributions to the country's economic growth between 2004 and 2012 show the important role played by the Industrial and Medium Development regions for achieving better GDP performance nationwide. When we compare their contributions to those of the remaining regions, we see that these two regions alone have contributed an average of 76.6% to the nation's economic growth between 2004 and 2012 (see Chart 2c.2).

e/in-house estimates Source: BBVA Research with data from INEGI

Regional contribution to national economic growth (%)

Source: BBVA Research with data from INEGI

¹ There is a detailed description, in Spanish, of this classification in *Situación Sectorial Regional México*, "Agrupamiento Regional, Cómo y Para Qué", November 2007. BBVA Bancomer. Regions by economic vocation and level of development: High Development: DF; Touristic: BCS and QR; Industrial: Ags, BC, Coah, Chih, Jal, Méx, NL, Qro, Son, Tamps; Medium Development: Camp, Col, Dgo, Gto, Hgo, Mich, Mor, Nay, Pue, SLP, Sin, Tab, Tlax, Ver, Yuc, Zac; Low Development: Chis, Gro and Oax.

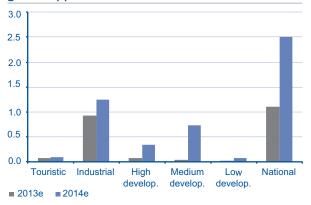

The acceleration in economic growth expected for the Medium Development region will add 0.7pp to national economic growth in 2014

As mentioned above, the regional breakdown of the national economic growth forecast for 2014 allows us to pinpoint the Medium Development and Industrial regions as those which will contribute most to the country's improved economic performance over 2013. Although most of the regions will probably post better results, the Medium Development region stands out for having recovered its contribution to growth (see Chart 2c.3). This region's forecasted contribution is 0.7pp in 2014 vs. 0.0pp the year before. We should mention that this region has added an average of 1.0pp during the years of national economic expansion between 2004 and 2012 (see Chart 4).

When it comes to the industrial region, we estimate that it is likely to contribute 1.3pp in 2014. This greater momentum would represent a 0.4pp increase in its contribution to the nation's growth over 2013. To get a better notion of what this momentum means, it is important to point out that this region has contributed an average of 1.9pp to growth during the years of expansion between 2004 and 2012 (see Chart 2c.4).

Box 1: The impact of more hydrocarbon extraction on the economic growth of the producer states

The introduction of secondary energy legislation looks, above all, to facilitate the expansion of national hydrocarbon production in the coming years. Without a doubt, the benefits of this will mainly be seen in those states that concentrate hydrocarbon resources, whether conventional or unconventional. If this higher production level becomes a reality we will also see further economic growth, above and beyond the *status quo*, in each one of these states.

Our estimates indicate that an adequate implementation of secondary energy laws could raise the Mexican economy's potential growth by at least 1pp by 2018 (see Chart B1.1). Although the country's increased potential growth would be a result of the combination of higher investment in and production of hydrocarbons, improvements in the electricity industry's efficiency and potentially lower energy costs for other productive sectors in the economy, in this analysis we assume that this increase would only be due to greater extraction of hydrocarbons in those states where they are currently being produced. In other words, this economic impact analysis will focus on nine states: Campeche, Tabasco, Veracruz, Chiapas, Tamaulipas, Nuevo León, Coahuila and San Luis Potosí.

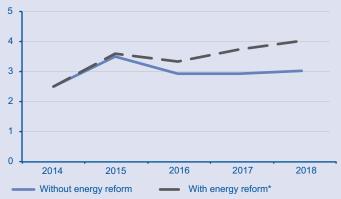

The federal government's forecasts indicate that average oil production could rise from approximately 2.35 million barrels per day (mmb/d) to 2.84 mmb/d by 2018. Bearing

this in mind, we carried out a quantitative analysis on the assumption that the production of both oil and natural gas will increase by 20% by then. Among other assumptions used for the analysis, the participation in the extraction of hydrocarbons from shallow waters (generally attributed to Campeche in the national accounts) will fall by 20% by 2018 compared to 2014 (see Chart B1.2).

The 20% reduction in Campeche's quota will have to be fully offset by greater participation from the other states listed. In order to simplify the analysis, we decided to prorate the drop in Campeche's share among the remaining states. Notwithstanding the aforementioned, on the assumption that national oil production will rise by 20% by 2018, the production of hydrocarbons from Campeche will only fall by 3.4% compared with the amount forecasted for this year. It is worth mentioning that deepwater fields are not located along Campeche's coastline.

In order to measure the impact of expanded hydrocarbon production on each state's economic growth in 2018, the following procedure was used: i) the 20% increase in the nation's hydrocarbon production was distributed among the states taking into consideration the growth of the state hydrocarbon production derived from the new state participation structure (see Chart B1.3); ii) using these forecasts for 2018, state incidences that would account for a

Chart B11

Chart B1.2

Share in hydrocarbon production nationwide

(fraction of the total)

^{*} We assume that Campeche's participation will have fallen by 20% by 2018; and this percentage has been prorated among the other states.

Source: BBVA Research with data from SIE and Pemex

1pp increase in the Mexican economy's growth potential were calculated; iii) the state additional economic growth for the 2014-2018 period was calculated, and iv) the compounded annual growth rate of additional state economic growth corresponding to this period was used as a proxy variable for additional state economic growth in 2018.

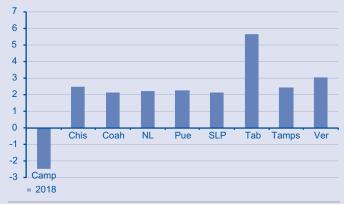

The results obtained indicate that all the states, with the exception of Campeche, will report positive rates of economic growth above those they would have without the energy reform. Moreover, expanded hydrocarbon production will imply that Tabasco, Chiapas and San Luis Potosí will be in the best position to accelerate their economic growth for 2018 (see Chart B1.4).

Conclusions

This analysis had the purpose to quantify the economic impact of the energy reform on the hydrocarbon-producing states. However, the results of the analysis should be treated with caution for the following reasons: i) the allocation to these states of the entire 1pp increase in the Mexican economy's potential growth by 2018; ii) the change in the structure of state participation in national hydrocarbon production, derived from the assumption that Campeche will have a smaller share by 2018, which was prorated among the remaining producer states, and iii) the assumption of a 20% increase in national hydrocarbon production by 2018.

3. Special reports

3a. Relevant issues around some of the secondary energy laws

The new Hydrocarbons Revenue Law simplifies the oil rent under a new fiscal regime for hydrocarbon fields

Payments to the State will be made under just four headings: a fee for the hydrocarbon exploration phase, royalties on the value of production, a percentage on the operating profit, and income taxes (ISR for its acronym in Spanish). The fee will be paid monthly and will be calculated solely on the basis of that part of the allocation area or contract that is still at the exploration stage. As for the royalties, they will be payable through formulas which have a built-in progression (a higher proportion of revenues received by the state) that will be activated when hydrocarbon prices exceed a certain limit or when the fields end up more productive than it had been anticipated when the contract was awarded. In terms of the percentage of the operating profit (contractual value of hydrocarbons less the sum of royalties and the amount allowed for cost recovery), this will be determined by the economic terms applying to the fiscal regime of the contracts designed by the Ministry of Finance. Finally, for income tax payments, fiscal consolidation, which might occur with companies holding more than one contract, will not be allowed.

Assessment: positive, for having come up with an internationally competitive formula for calculating royalties, given that prices under US \$88 per barrel will trigger a royalty under 12.5%, a figure which is common for the percentage of royalties paid in the US for hydrocarbon extraction. In addition, the Hydrocarbon Revenue Law seeks to incentivize investment in difficult-to-extract hydrocarbon's fields by allowing a higher proportion of costs to be deducted when calculating the operating profit. Nevertheless, the relative success in attracting private capital to the hydrocarbon sector will depend to a large degree on the fiscal conditions determined by the Ministry of Finance for these contracts.

Pemex will continue to be a major contributor to public revenue through the annual payments for the rights to shared profits

The rights to shared profits will be established by applying a duty of 70% in 2015 to the operating profit on activities related to hydrocarbon production carried out in allocated fields. This percentage will fall by 1.25pp a year, down to 65% by 2019. Similarly, given that the rights to shared profits will vary depending on the profitability of the project, the Hydrocarbon Revenue Law allows the cost limits to be pushed up in order to speed up investment recovery, depending on the type of field: onshore, non-associated gas, shallow water or deep water. For example, by 2019, the deduction will never be higher than 12.5% of the annual value of hydrocarbons that are different from non-associated natural gas and its condensates, extracted in onshore or shallow-water areas. In cases such as Chicontepec and deepwater fields, this upper threshold will rise to 60% of the annual value of these hydrocarbons.

Assessment: neutral; although it is important for sound public finances that a significant perturbation to public revenues does not occur, Pemex may not be in optimal conditions to compete with other firms, in view of the excessively slow reduction in the operating profit percentage it will have to pay until 2018. The fiscal stability pact agreed between the federal government and the private sector suggests that Pemex will have to operate with this budget restriction at least until the end of the current federal administration.

Pemex and CFE could be more competitive at the expense of a higher public sector's debt to GDP ratio

The federal government will assume as public debt the proportion of Pemex and CFE's payment obligations for their labor liabilities that is equivalent to the amount by which they can be reduced as a result of the modifications made to the collective labor contracts. This will become a support instrument for both companies in their transition to the new regime of public-sector productive companies, for two reasons: i) Pemex and CFE will use a lower proportion of total expenditure in meeting these obligations (13% and 23% to paying pensions and retirement packages in 2013, respectively); and ii) the actuarial liability will fall significantly as modifications are made to their collective labor contract, implying a substantial hike in the retirement age.

Assessment: neutral; explicitly taking on Pemex and CFE's labor liabilities as federal government debt could increase the federal government's borrowing costs and reduce the likelihood of an improvement in the credit rating of Mexico's sovereign debt in the short and medium term.

The Mexican Oil Fund is unlikely to accumulate resources right away

This fund will administer oil revenue, will have the central bank as a trustee and will be excluded from the provisions applicable to the federal government's public trusts. Decisions about using the fund's resources will be made by a Technical Committee consisting of two representatives of the Federal Government (the Ministers of Finance and Energy), an independent federal government institution (Banco de México, the central bank) and four independent board members, previously approved by the Senate. The execution functions for managing oil revenue will be the responsibility of a team led by an Executive Coordinator and people under her supervision. As employees of the central bank, the team will be required to implement the Technical Committee's instructions.

The Fund will not begin to accumulate resources until the Federation's Expenses Budget has been allocated the equivalent of 4.7% of that year's GDP. Similarly, when the Fund's reserve is bigger than 3% of the previous year's GDP, the additional resources will be spent on the following items: the universal pension system; investment projects in science, technology and innovation, and in renewable energies; an investment vehicle specializing in oil projects and infrastructure for national development; training grants for people at universities and postgraduate institutions; projects to improve connectivity and for regional development of industries. With the exception of the grants program, additional resources might not be used for current expenditure.

Assessment: neutral, given that the federal government could not part with these resources from one year to the next, it would have been desirable that this amount had been gotten gradually reduced. Consequently, one of the goals of the energy reform does not get fulfilled: diminishing the dependence of public revenue on the oil rent. Accumulating additional resources will only be feasible through a higher production of oil, more public income from other sources and/or cuts to current public spending.

The success of the electric power industry's restructuring will depend to a large degree on having both enough competition in generation and an efficiently managed and regulated transmission network

The new Electric Power Industry Law will enable users of basic services to acquire electricity solely from one supplier, while other users of qualified services can do so by taking part directly in the Wholesale Electricity Market (spot market) or via a supplier of qualified services. We should point out that users of basic services (the vast majority of the approximately 38 million users of CFE, the state-owned electric power company) will continue to pay electricity tariffs regulated by the Energy Regulatory Commission (CRE for its acronym in Spanish). Users of qualified services, meanwhile, will be able to buy electricity at spot prices or sign long-term contracts with generators at fixed prices. With this new system for acquiring electricity, the number of participants on the demand side will be a key factor to encouraging more entrants into the competitive electricity generation market. Additionally, to help qualified services get better electricity prices, the generation companies will have to woo these customers, even if they are part of customer portfolios of the suppliers with whom they have electricity purchasing contracts.

Apart from what was aforementioned to promote a dynamic spot market, in order to mitigate potential market power problems that might be caused by network congestion, there will have to be efficient control mechanisms for the network and regulations concerning the concentration of financial transmission rights in the hands of generation companies concentrated in nodes where electricity access is difficult. Furthermore, we recommend that the market power of potentially dominant players be restricted by regulated forward contracts. Equally, or even more importantly, the Minister of Energy, the CRE and the Independent System Operator (CENACE for its acronym in Spanish) must take on, among other matters, a role of strict market monitoring to detect possible monopoly practices which might restrict the efficient operation of the Wholesale Electricity Market and, if necessary, must inform the Federal Competition Commission so that it can proceed according to its mandate.

Following the recommendations of successful international experiences in restructuring electricity markets, the Electric Power Industry Law establishes the functionally or legally vertical separation -ring-fencing- for CFE. Although generation, transmission and distribution of electricity in this company will be separated, this law does not seem

to recognize the need for horizontal restructuring in the generation segment in order to increase the number of participants. Electricity production is currently divided roughly as follows: CFE with 67%, independent producers with 20%, and the remaining 13% accounted for by self-generation and cogeneration. This is why it is crucial that new players join the generation segment through mechanisms designed by the CRE, which will create a favorable scenario for the efficient positioning and interconnection of new electricity plants.

Assessment: neutral; the new Electric Power Industry Law does not ex-ante address the potential market power issues in a structural way for the generation segment, and tries to remedy them ex-post through the monitoring of competition conditions and resolutions taken by the Federal Competition Commission for this segment and the rest. Neither does the new law specify an incentive-based regulatory framework for electricity transmission and distribution segments. This would help to bring about, over time, a reduction in the costs of electricity delivery.

3b. Mexico consolidates its position as a powerful global automotive exporter

Introduction

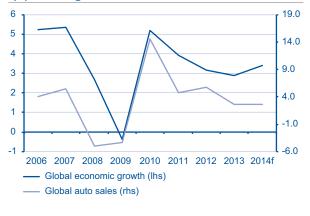

This section analyzes the extraordinary growth of Mexico's automotive industry since the North American industry was restructured in 2007. This expansion is foreseen to continue at even faster rates, with positive impacts in terms of investment (new assembly plants and suppliers) and employment. The global trend of outsourcing production from developed to emerging countries lies behind these expectations. In the context of emerging economies, Mexico has become one of the most profitable export platforms in the world with high quality at lower costs, competing for the carmaker supremacy with its North America Free Trade Agreement (NAFTA) partners, particularly with the USA.

Some of the global automotive trends

The global demand for light vehicles is accelerating, especially in Asia. In 2013, new vehicle sales rose to 83.5 million units, up 3% from 2012. By the end of 2014, global demand could reach 85.4 million units, the highest figure ever. Since the recession of 2008-2009 and up to 2014, there will have been 21 million more vehicles. By 2020, specialists estimate that sales might exceed 100 million units a year.

Chart 3b1

Global economic growth and light vehicle sales
(y/y % change)

| Total | 83.3 | 85.4 | 103.2 | 19.9 | 3.1 | 23.9 |

Source: BBVA Research with data from IHS April 2014

This performance has been driven by the increasing wealth in emerging markets (led by China), which for the first time contributed with 50% to total sales in 2010. Since then the emerging markets have extended their advantage in total global sales, accounting for 55% of the total in 2013.

By 2020, estimates indicate that the Asia-Pacific nations will account for 45.8% of total sales or with 15pp of the total growth anticipated to occur between 2013 and 2020, which is forecasted to be 23.9%. Previsions for Western Europe area show a modest rise, more of a bounce back than an expansion in income or in population.

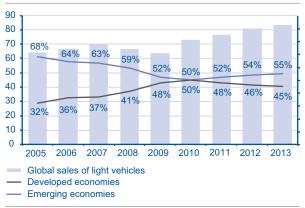

Chart 3b2 **Automotive markets with growth potential**

Source: BBVA Research with data from World Bank

Chart 3b3

Global sales of light vehicles
(million units and % share)

Source: BBVA Research with data from OICA

For automotive manufacturers and their suppliers, the fast growth of emerging markets has meant major changes. These include new production plants in these areas, adjustments to plant sizes, types of vehicles produced and strategic alliances in order to compete. In the developed economies, the general trend was to cut down production in 2008 and 2009 because of the economic recession before increasing it again since 2010. In most of these economies, production is still below its 2007 levels. Not until 2012, the pattern in developed countries started to diverge with European production continuing its decline, whereas in other countries, such as the US and Japan, in crescendo. The main vehicle producers in emerging countries such as China, Korea, India, Brazil, Mexico and Thailand, contributed with 45% to global production in 2013 vs. 26% in 2007.

Utilization of installed capacity in North America is at high levels, even higher than before the crisis. The area is consolidating after a restructuring, with sales and earnings on the path to recovery. Installed capacity in North America is estimated to grow by 4.4% between 2013 and 2018, and it could be Mexico that would be providing most of the new production capacity. By contrast, Europe will probably have to make further adjustments to eliminate excess installed capacity; Japan and Korea are in a similar fixing up-mode where reductions have already begun. Plant closures bring with them harsh challenges on the employment side, especially if we take into account the high and long-lasting unemployment rates in Europe.

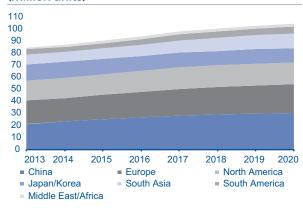

Table 3b.2

Main vehicle producers in the world: developed and emerging ('000s of units)

Chart 3b.4
World vehicle production 2014-20
(million units)

Source: BBVA Research with data from OICA

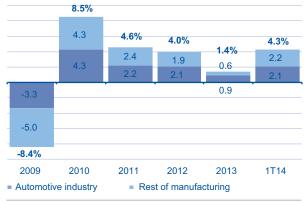

By 2020 production is estimated to rise to around 105 million units. China will remain the biggest producer with 30% of the total. Moreover, the outsourcing of production from developed to emerging nations is expected to continue with the aim of both being closer to demand and reducing costs, plus the availability of key inputs. We can also expect to see a wave of new associations and alliances between manufacturers in order to compete successfully.

The automotive industry in Mexico has become a powerful buffer before the slow phases of the business cycle

The automotive industry has shown remarkable growth in Mexico since the North American industrial restructuring of 2008-2010. The industry has increased its importance in manufactured production, rising from 11.1% in 2008 to 17.1% in 1Q14 and becoming the sector with the highest weighting in the country after the processed food sector. This is the result of a high (about 50%) direct contribution to growth of manufacturing in recent years. Indirectly, it has influenced the production of spare parts, plastics, glass, steel, iron and services, among others.

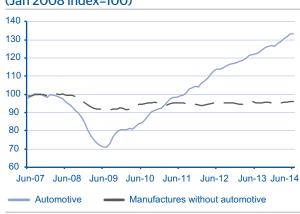

Chart 3b5

Contribution of the automotive industry to growth of manufacturing (pp)

Source: BBVA Research with data from INEGI

Chart 3b6
Employment in the automotive industry
(Jan 2008 index=100)

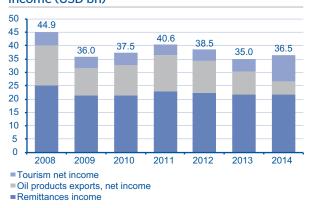

Source: BBVA Research with data from INEGI

In regards to employment, and despite the automotive industry being notably capital intensive, it has generated over 309k direct jobs since the crisis, rising from its lowest point in July 2009 of 359k to 675k in June 2014. Employment in manufacturing, excluding the the automotive sector, remains stagnant. In fact, since the crisis and up to June 2014 it has generated 133k jobs, and has yet to recover to its pre-recession levels.

Another indicator flagging the importance that the auto industry has acquired in Mexico is its contribution to the external accounts in recent years. In terms of net oil and tourism revenues, as well as remittance income -which altogether add up to US \$35bn- the auto industry makes a net contribution to the country's exports of approximately US \$40bn, making it the biggest source of foreign currency.

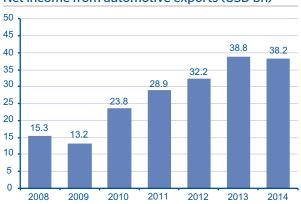

Chart 3b.7

Net oil and tourism revenue and remittance income (USD bn)

Chart 3b.8 Net income from automotive exports (USD bn)

Source: BBVA Research with INEGI data. For 2014 the figure is annualized to 1Q14.

The auto industry in Mexico consolidates its place as the fourth biggest export platform in the world

The Mexican automotive industry is now one of the ten most dynamic and competitive in the world. In 2013 it held on its position for the third year in a row as the eighth biggest producer of light vehicles in the world (3 million units) and the sixth biggest in heavy vehicles (141k units). Likewise, most (82.6%) of total production is exported, making it the fourth most important automotive exporter in the world in 2013 (up from the eighth position in 2009), behind only Germany, Japan and the US.

Table 3b.3

Mexico is among the 10 biggest vehicle producers in the world in 2013

The Mexican auto industry is strongly integrated with the US

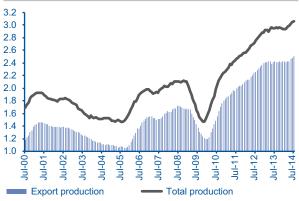

Most of the leading producers and suppliers, whether foreign or domestic, are still investing in manufacturing in Mexico. Low costs, the suppliers' network and international trade treaties all contribute to shape an attractive export platform for the NAFTA market and the rest of the world. The domestic market is very small and only two manufacturers use their Mexican plants to service their local and export markets.

Since the industry restructuring in the US and up until now, the production of light and heavy vehicles in Mexico has doubled; a good part of this expansion is due to exports growth. In 2013 the ratio of exports to production of light and heavy vehicles was 82.6% and 71.3%, respectively. The manufacturer with the lowest export ratio was Nissan with 67%.

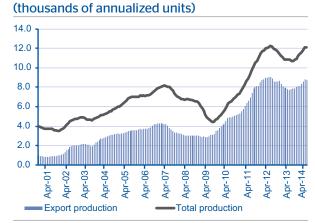

Chart 3b.9

Chart 3b:10 Production of heavy vehicles in Mexico

Source: BBVA Research with data from Anpact

The competitiveness of the automotive industry has attracted the presence of the most important firms in the world and has spurred many of them to choose Mexico as a single manufacturing platform for all their markets. The eight companies have 18 production centres in 11 states around the country, where they carry out assembly and armoring operations, stamping and smelting of vehicles and engines. The country hosts 11 producers of heavy vehicles and two of large-capacity engines.

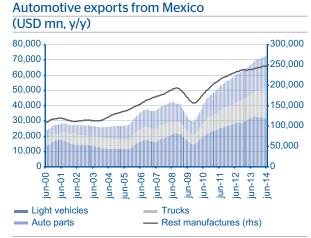

The carmakers in Mexico have gained ground in competitive terms, enabling the country to climb to another level with the forthcoming installation of three manufacturers of premium light vehicles: two German and one German-Japanese joint-venture production. The arrival of a Korean compact vehicle firm is also expected. These new companies will add 450k units to current capacity between 2016 and 2019, but above all it will be an opportunity to increase the aggregate value in production by acquiring new capacity with European suppliers that are expected to arrive soon.

In 2013 the country's automotive exports were worth US \$70.7bn, representing 22.5% of manufacturing exports and 18.5% of total exports. The value of automotive exports has more than doubled in less than four years, rising from US \$30bn to US \$73.3bn in June 2014 with year-over-year (y/y) figures. In 1H14 the momentum of automotive exports increased 9.7% vs. 3.8% in non-automotive manufacturing exports.

The US remains far and away the main destination for Mexican exports of light and heavy vehicles, as well as spare parts, but Mexico has also become a low-cost production base for global exports.

Mexico's integration with the US economy has driven the growth of automotive production and investment but it has also meant that the industry's performance is increasingly linked to the US economy and, as such, any crisis or collapse in the external demand from the US would affect the industry located in Mexico.

Aggregate automotive FDI (foreign direct investment) since the restructuring of the North American automotive industry in 2009 to 2013 came in at US \$12bn. Over the next five years it is foreseen that such investment will exceed US \$3bn on an annual basis. The vehicle manufacturers will invest around US \$8bn between 2014 and 2019 in projects that have already been announced, plus another similar or higher figure in the manufacturing of spare parts.

Closing comments

Two decades have gone by since one of the most far-reaching economic blocks, and with the greatest global projection for its members, came into being. NAFTA has consolidated the automotive sector, and Mexico has been the biggest beneficiary.

It is not just the lower labor costs that are helping to increase production; it is the proximity to the US and the supply chain that both countries have developed, as well as the international trade treaties.

The challenge for Mexico is to continue raising competitiveness so as to achieve greater participation in the US market. This is feasible, if we bear in mind the new capacity that is said might be installed in Mexico, and also if the country focuses on achieving greater commercial diversification. As long as Mexico makes it possible for domestic and foreign companies to operate with simple requirements, little bureaucratic paperwork, etc., there is an increasing likelihood that automotive and spare parts firms will decide to expand their operations in Mexico.

Creating the domestic and international supply chain needed to manufacture premium vehicles involves considerable challenges (high standards in technology, efficiency, design and safety) and such chain will have to show that quality can be obtained in Mexico. A major hurdle consists of involving local suppliers as high amounts of long-term capital are needed and some know-how is required for doing business within a global industry; the market potential is around US \$35bn worth of products that are currently imported. This will help to increase the country's share in spare parts manufacturing that currently stands at 25%.

3c. Domestic and international tourism: a two-speed story

Tourism in the world contributes with 9.5% to global GDP. It also provides 8.9% of jobs throughout the world (265.8 million people). Of all worldwide investment, it is estimated that 4.4% goes into the tourism sector. This activity has a direct impact on hotels, entertainment, transport, attractions, conferences and conventions. It makes an indirect contribution to investment in tourism and trips, government and suppliers. Likewise, it drives demand for food and beverages, clothing, accommodation and leisure.

Global tourism, more destinations, greater connection

Tourism has become a viable alternative for many regions and countries that formerly did not compete. Nevertheless, this economic growth path is not risk-free. Politically motivated events such as 9/11, as well as the attacks in Madrid and London, had a short-term adverse effect on tourism. Other unfavorable factors have been health risks such as SARS and H1N1, natural disasters (the tsunami in Indonesia and major hurricanes in New Orleans and the Mexican Caribbean), which put climate change on the tourism agenda, and more recently the economic contraction in industrialized countries. All these things affect tourism, not only at a local level, but also at a regional and global one.

In 2013 and up until April 2014, tourism continued to strengthen in line with progress in global economic activity. This performance meant that 2013 ended with new record highs in international arrivals (visitors who spend the night), with 1.087 billion in 2013, equivalent to an annual growth rate of 5.1% (see Table 3c.1). From January to April 2014, the rate of international arrivals continued to rise (4.7%), thus an increase of between 4% and 5% by the end of the year, as estimated by the UNWTO, could be feasible.

Table 3c1

Source: BBVA Research with data from UNWTO

The performance of different regions in the world, according to the WTO, was as follows: the Asia-Pacific region, with 23% of the total, shows the highest and most sustained rates. It is followed by Africa and Europe, although this final region accounts for the biggest contribution in terms of total arrivals, at around 52%. The Americas region is improving, particularly in 2014 so far. The biggest growth by the end of 2014 will come from the Asia Pacific region, with between 5% and 6%, followed by Africa and the Americas. All the regions, apart from Africa and the Middle East, are growing above the long-term 2005-13 trend. The main purpose of tourist visits continues to be rest and recreation (52%), followed by medical treatments, health and religious visits (27%) and business (14%), with the remaining 7% unspecified.

As a consequence of the positive performance of international arrivals, global income from tourism increased 5% in real terms (considering the exchange-rate and inflation fluctuations) and 7% in nominal terms, bringing in US \$1.159trn in 2013 (see Table 3c.2). Europe accounted for 42.2% of total revenue by arrivals. Asia-Pacific destinations mopped

up 31% of the whole, while the Americas had a 19.8% share. Based on the high correlation between real income and arrivals, it is likely that the positive change in arrivals between January and April 2014 will have been shown in terms of income.

The top four tourist destinations in the world, both in terms of inbound tourists and the FX brought by them are still France, the US, Spain and China. Traditional markets are consolidating their hold on their positions while emerging destinations are gaining market share (see Table 3c.3). Tourism has become a key factor worldwide in socio-economic progress because of the revenue it generates, plus the jobs and infrastructure development it creates, allowing the number of destinations to grow.

In terms of tourism income, the US retained the number one place (US \$139.6bn). It was followed by Spain with US \$60.4bn, France with US \$56.1bn and China with US \$51.7bn. Mexico came in 23rd place with US \$13.8bn (see Table 3c.4).

Mexican tourism statistics in 2013

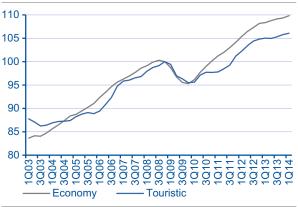

- It contributed with 8.3% to GDP in 2013, a high rate if we consider the contributions of Spain and New Zealand to their GDP with 10.9% and 8.6% in 2012, respectively
- Created over 2 million direct jobs
- FDI provides national, regional and local development opportunities
- It is the fourth source of FX after the automotive industry, FDI and remittances
- Mexico is the top Latin American destination in both tourist numbers and income
- · Mexican tourism does not consist only of holidays and accommodation; business takes on a significant share
- Tourism GDP contributed with 68.2% of total accommodation services; 37% of catering services; 32% of leisure activities; and 22.4% of transport
- There are over 18k hotels and more than 672k bedrooms, according to the latest 2013 figures
- The domestic market contributes with around 80% of the country's tourism consumption
- The country ranks 44th in the World Economic Forum's 2013 world ranking of tourism competitiveness

Economic activity in tourism continues to grow

Tourism's share in the Mexican economy has remained stable over the years, despite the high potential of its natural and cultural resources. According to the National Institute of Statistics and Geography (INEGI, for its acronym in Spanish), this industry has had good results, which can be seen in the Tourism Gross Domestic Product (TGDP) for the last few years. Having dealt well with several adverse factors for tourism that occurred in 2013, such as the economic crisis in several European countries and the low growth of domestic consumption, among others, tourism in Mexico has remained in growth up to 1H14, although with some lag in relation to total economic activity (see Charts 3c.1 and 3c.2).

Chart 3c.1

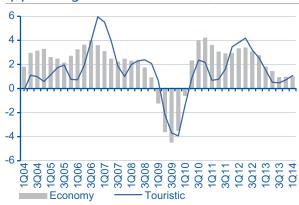

Tourism Gross Domestic Product
(2008 index=100 annualized)

Source: BBVA Research with data from INEGI

Chart 3c.2

Tourism Gross Domestic Product
(y/y % change with annualized data)

Source: BBVA Research with data from INEGI

Tourism GDP involves a mix of economic goods and services activities. In 2012, according to the Tourism Satellite Account (2008 base =100), tourism accounted for 68.2% of the temporary accommodation services' sector in Mexico, while the goods produced by tourism made a contribution of 7.3% to the country's manufacturing production (see Chart 3c.3).

Tourism demand

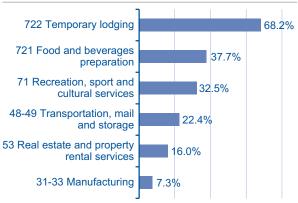

Tourism consumption is divided into three types: i) internal, or domestic, tourism (84% of the whole), which covers the residents of the country who travel within it; ii) reception, or incoming, tourism (9.4%), which comprises the non-residents traveling to the country, and iii) outbound tourism (6.6%), the residents of the country who travel abroad. Domestic tourism plus incoming tourism is termed *interior tourism*. The consumption of this type of tourism is already higher than in 2008, indicating that the numerous events affecting it (such as the 2008-09 global economic recession, the H1N1 health emergency and the hurricanes (see Chart 3c.4) have been overcome.

In 1Q14 incoming tourism consumption rose at an annual rate of 14.8%, continuing its positive, and growing, trend noted in 3Q13. By contrast, domestic tourism consumption fell back by 1.1%, temporarily interrupting its favourable trend, due to the adverse effects caused by the tax reform on both household and company income: the positive trend is expected to return in 2Q14.

Inbound international tourism in Mexico

International visitors are spending more. During 1H14, expenditure by foreign visitors posted very positive results for the third year in a row, reaching US \$8.4bn, which represented a major increase of 17.6% y/y, exceeding the 2008 record by US \$1.1bn (see Chart 3c.6). This performance was driven by an annual growth of 21.5% in the money spent by tourists; trippers, on the other hand, spent 5.5% less on an annual basis. Tourists' expenditure comes from receptive or incoming tourism (spending the night) and border tourism. The first has much more impact on total expenditure and FX generation.

Chart 3c.5

Source: BBVA Research with data from INEGI, CST 2014

Chart 3c.6

Expenditure of international visitors (USD bn from January-June every year & y/y % change)

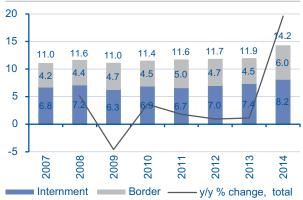

Source: BBVA Research with data from the central bank

International tourists (staying overnight) arriving in the country grew by 19.6% at an annual rate, reaching 14.2 million people. There were major increases in the sub-groups of incoming (10.1%) and border-crossing tourists (35.5%). They had average expenditures of US \$868 and US \$59, equivalent to an annual increment of 9.7% and 3.1%, respectively. Moreover, of the total incoming tourists' arrivals, 88% of them came in by air and the remaining 12% on roads, with an increase of 10.7% and 5.4%, respectively.

Chart 3c.7
International tourist arrivals
(y/y % change, 6Mo6M)

Source: BBVA Research with data from The central bank

Chart 3c.8

Average expenditure by incoming tourism

(USD per person, 1H each year, y/y % change)

Source: BBVA Research with data from The central bank

In 1H14 US visitors arriving by air increased by 13.1% y/y, with over 3.9 million passengers of which 56% of them came in by air. Meanwhile, Canadian visitors represented over a million entries, an annual increase of 5.9%.

On the one hand, the steep growth in border tourism arrivals was striking; if confirmed, it might be due to a greater trade momentum between the Mexican and US borders; it will be the first growth figure after several years of stagnation. On the other, the average expenditure of incoming tourists continued to recover in 1H14, and has now exceeded the 2008 levels (see Chart 3c.8).

Record figures were posted for FX from international arrivals and in the tourism balance in 1H14. Mexico received US \$8.4bn in 1H14, a new record for the first six months of a year. The tourism balance came in at US \$4.1mn, an annual increase of 29.2%.

Domestic tourism. Up until July of this year, 28.4 million national tourists stayed in the country's hotels, representing a y/y increase of 5%, a lower figure than a year ago. The country's low economic growth and, above all, the higher tax burden on individuals had an impact on this performance. This was also reflected on a 5.6% increase in local flights arrivals, less than the 10.6% growth of international flights. Local tourism accounts for 80% of the country's tourism consumption, and is the main driver for most destinations, particularly those located in the major cities (Mexico City) and in the interior, together with traditional beach destinations.

Hotel activity in Mexico

Another way of analyzing the performance of the tourism sector is through arrivals and occupancy in the hotel industry by tourists origin (local or residents, international or non-resident) and by the type of destination, that is, city (large and in the interior) and beach (traditional destinations, complexes and others). Datatur has data on hotel services at 70 destinations, whose demand is more than 75% dependent on domestic visitors; this group is particularly important for large cities and those in the interior, as well as for traditional beach places, while the remaining 25% is met by demand from international travelers, especially sun, sea and sand destinations such as the Mexican Caribbean and the Los Cabos' corridor.

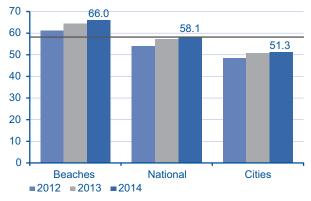

Determinants for city destinations. Hotel services in urban centers operate around two major forces. The first is the amount of economic activity generated at or near the location. The second is the floating population deriving from migration patterns or travelers in transit who spend a night on their journey. There are also characteristic elements that increase the attraction of particular cities, such as: the cultural offering; their infrastructure for holding congresses or conventions; the price and quality of medical services, which may attract visitors in search of treatments; or features such as the climate, countryside or whether the city, or part of it, is picturesque. Nevertheless, the main reason, which accounts for the growth of occupancy rates and visitor reception, is economic. The more that services, trade and industry develop inside or around a city, the more it will attract travelers arriving with business objectives. This explains why the large urban areas in the country have the highest rates of occupancy and perform, on the whole, better than cities on the borders and those in the interior.

According to information published in the weekly report on hotel occupancy issued by Datatur, the average accumulated rate up to July 28th 2014, week 30 of the year, was 58.1%, 1pp higher than in the same period of 2013; with a rate of 51.3% (+0.5pp) for cities. In the overall average, occupancy rates show a rising trend, but less robustly than in 2013, linked to the low economic growth of 1Q14. Among major cities, Mexico City showed the highest rate of occupancy, with Monterrey and Guadalajara trailing at a distance.

The average rate in urban centres in the interior was 46.6% (+0.3pp) on average in 2014. Progress was modest compared with 2013, when it achieved +1.8pp. In the regions, though, there have been marked variations in the occupancy figures. While some areas progressed, others lost ground. In the case of city hotels in the interior, the Bajío area (see Chart 3c.12) showed major progress, driven by investment in new plants and automotive suppliers in the zone. Future auto investments will trigger not only higher occupancy, but also investments in hotels and property. Average occupancy along the northern border is still not showing a sustained improvement, with the occupancy rate at 46.2% (-0.4pp) in 2014, a figure which compares unfavorably with the 2.6pp rise in 2013. In 2014, occupancy in

border states was affected by the VAT hike from 11% to 16% and lower business activity in the region; the exception was Ciudad Juárez, perhaps due to a perceived improvement in public safety.

Beach destinations. In the case of sun, sea and sand destinations, the Mexican Caribbean and the Los Cabos' corridor, which are the most important magnets for foreign tourists, have made major progress. The destination with the highest rates of occupancy is the Caribbean, with occupancy rates of 81.8% (+1.2pp), although the increase was more robust in 2013. In the Los Cabos area, progress was more intense in 2013 as well. Hotel occupancy in traditional beach destinations (Acapulco, Veracruz and Mazatlán), while increasing, is doing so at a slow pace, in line with domestic consumption. In 2014, the area of Nuevo Vallarta jumped considerably when its occupancy rate went up to 71.1% (+4.9pp), perhaps as a result of a more balanced composition between resident and non-resident visitors.

Challenges

For the second half of 2014, we expect tourism in Mexico to continue growing in terms of attracting more tourists, their average expenditure and occupancy levels. The differences among regions will persist. While those destinations targeting foreign tourism and occupancy in major cities will make progress, the places mainly visited by local tourists, together with medium-sized and border towns could improve in the light of better economic growth expectations for 2H14. Beach tourism has made satisfactory progress over the year, and we expect occupancy rates to continue rising, helped in particular by demand from foreign tourists. The business segment is clearly growing, as it is the case in Mexico City and the Bajío area.

The tourism sector in Mexico faces several challenges: the worrisome very low rate of growth, dependent on the exterior; the trade and investment dependence on the US, and the reduction in expenditure in the domestic market. The situation of the US and European economies is also a cause for concern for Mexico; the first - the main source of tourists to Mexico - is moving at a very slow rate, while the second -the biggest source in the world- is still showing a slow recovery. It would be a great feat if Mexico were to succeed in positioning itself as an attractive destination in under-developed segments (and not just sun, sea and sand), such as tourism based on culture, ecotourism and adventure, health, sports, business and religion, to mention only a few.

5. Special Reports Included in Previous Issues

First Half 2014

Mexico's major challenge is maintaining and winning participation in global value chains Manufacturing exports gained competitiveness over the last decade Energy reform and the implementation challenges for hydrocarbon production

June 2013

Household electrical appliances industry: challenges & opportunities to improve its competitive position. The electronics industry in Mexico and the challenge of increasing productivity. Key sectors to an effective energy reform

November 2012

Toward a better management of Mexican subnational public debt.

Energy in Mexico: facing innumerable challenges and opportunities.

May 2012

Analysis of the Competitiveness of Mexican Exports in the U.S. Severe drought in Mexico: a marginal impact on total GDP but important in micro regions.

October 2011

Which are the most competitive sectors in Mexico? A focus on production costs. Is it possible to obtain greater brilliance from metallurgical-mining in Mexico?.

January 2011

The automobile industry in Mexico is benefiting from the restructuring in the U.S., although it is facing strong global competition.

The challenges posed by electric vehicles for the world.

Tourism in Mexico: facing the challenge of greater growth.

June 2010

Sectorial competitiveness of the Mexican economy: an evaluation against that of China.

Implications of the new methodology for measuring states' GDP.

Regional competitiveness: how much have we advanced and what do we still have to do?

Some indicators in countries with higher growth rates than Mexico.

The pending task: strengthen growth; implement second generation structural reforms.

July 2009

Which States will Be Most Affected by the Recession?

The Sectors Most Affected by the Recession.

The Motor Vehicle Industry Situation in Mexico.

The Impact of Swine Flu on Tourism.

Job Losses in 2009: How Many and Where?

July 2009 Infrastructure Special

Infrastructure, in Mexico and in the World. Key Issues in Financing.

Available in www.bbvaresearch.com in Spanish and English

DISCLAIMER

This document and the information, opinions, estimates and recommendations expressed herein, have been prepared by Banco Bilbao Vizcaya Argentaria, S.A. (hereinafter called "BBVA") to provide its customers with general information regarding the date of issue of the report and are subject to changes without prior notice. BBVA is not liable for giving notice of such changes or for updating the contents hereof

This document and its contents do not constitute an offer, invitation or solicitation to purchase or subscribe to any securities or other instruments, or to undertake or divest investments. Neither shall this document nor its contents form the basis of any contract, commitment or decision of any kind.

Investors who have access to this document should be aware that the securities, instruments or investments to which it refers may not be appropriate for them due to their specific investment goals, financial positions or risk profiles, as these have not been taken into account to prepare this report. Therefore, investors should make their own investment decisions considering the said circumstances and obtaining such specialized advice as may be necessary. The contents of this document is based upon information available to the public that has been obtained from sources considered to be reliable. However, such information has not been independently verified by BBVA and therefore no warranty, either express or implicit, is given regarding its accuracy, integrity or correctness. BBVA accepts no liability of any type for any direct or indirect losses arising from the use of the document or its contents. Investors should note that the past performance of securities or instruments or the historical results of investments do not guarantee future performance.

The market prices of securities or instruments or the results of investments could fluctuate against the interests of investors should be aware that they could even face a loss of their investment. Transactions in futures, options and securities or high-yield securities can involve high risks and are not appropriate for every investor. Indeed, in the case of some investments, the potential losses may exceed the amount of initial investment and, in such circumstances, investors may be required to pay more money to support those losses. Thus, before undertaking any transaction with these instruments, investors should be aware of their operation, as well as the rights, liabilities and risks implied by the same and the underlying stocks. Investors should also be aware that secondary markets for the said instruments may be limited or even not exist.

BBVA or any of its affiliates, as well as their respective executives and employees, may have a position in any of the securities or instruments referred to, directly or indirectly, in this document, or in any other related thereto; they may trade for their own account or for third-party account in those securities, provide consulting or other services to the issuer of the aforementioned securities or instruments or to companies related thereto or to their shareholders, executives or employees, or may have interests or perform transactions in those securities or instruments or related investments before or after the publication of this report, to the extent permitted by the applicable law.

BBVA or any of its affiliates' salespeople, traders, and other professionals may provide oral or written market commentary or trading strategies to its clients that reflect opinions that are contrary to the opinions expressed herein. Furthermore, BBVA or any of its affiliates' proprietary trading and investing businesses may make investment decisions that are inconsistent with the recommendations expressed herein. No part of this document may be (i) copied, photocopied or duplicated by any other form or means (ii) redistributed or (iii) quoted, without the prior written consent of BBVA. No part of this report may be copied, conveyed, distributed or furnished to any person or entity in any country (or persons or entities in the same) in which its distribution is prohibited by law. Failure to comply with these restrictions may breach the laws of the relevant jurisdiction.

This document is provided in the United Kingdom solely to those persons to whom it may be addressed according to the Financial Services and Markets Act 2000 (Financial Promotion) Order 2001 and it is not to be directly or indirectly delivered to or distributed among any other type of persons or entities. In particular, this document is only aimed at and can be delivered to the following persons or entities (i) those outside the United Kingdom (ii) those with expertise regarding investments as mentioned under Section 19(5) of Order 2001, (iii) high net worth entities and any other person or entity under Section 49(1) of Order 2001 to whom the contents hereof can be legally revealed.

The remuneration system concerning the analyst/s author/s of this report is based on multiple criteria, including the revenues obtained by BBVA and, indirectly, the results of BBVA Group in the fiscal year, which, in turn, include the results generated by the investment banking business; nevertheless, they do not receive any remuneration based on revenues from any specific transaction in investment banking.

BBVA Bancomer and the rest of BBVA Group who are not members of FINRA (Financial Industry Regulatory Authority), are not subject to the rules of disclosure for these members.

"BBVA Bancomer, BBVA and its subsidiaries, among which is BBVA Global Markets Research, are subject to the Corporate Policy Group in the field of BBVA Securities Markets. In each jurisdiction in which BBVA is active in the Securities Markets, the policy is complemented by an Internal Code of Conduct which complements the policy and guidelines in conjunction with other established guidelines to prevent and avoid conflicts of interest with respect to recommendations issued by analysts among which is the separation of areas. Corporate Policy is available at: www.bbva.com / Corporate Governance / Conduct in Securities Markets".
