Downward revisions to job gains show a weakening labor market

Javier Amador / David Cervantes / Fátima Del Río

May and June job growth revised sharply lower

Recent labor market data shows a marked slowdown over the past three months through July. Non-farm payrolls rose by just 73,000, a notably weak print compounded by significant downward revisions for the preceding two months and an uptick in the unemployment rate.

Substantial downward revisions to employment figures for May and June point to a notable shift in the labor market.. The initially reported gains of 144,000 and 147,000 jobs were revised down sharply to just 19,000 and 14,000, respectively. These adjustments imply a combined reduction of 258,000 jobs from earlier estimates. As a result, the average monthly job creation pace over the past three months has fallen to only 35,000 jobs, pointing to a near standstill in hiring activity.

The household survey data reported an increase in the unemployment rate from 4.1% to 4.2%. While still within the Federal Reserve's long-term range, this uptick, coupled with weak growth in labor force participation, which fell to 62.2%, its lowest since November 2022, underscores that the labor market is losing momentum.

Progress in wage growth easing has stalled this year. Average hourly earnings increased by 0.3% month-over-month, with annual growth at 3.9% while the three-month annualized growth rate increased by nearly 0.7 percentage points to 4.1%. These trends seem at odds with softening demand in the labor market, but could be reflecting the early effects of tightening immigration-related conditions. Data in the coming months will confirm whether that is the case.

The odds of a 25bp rate cut in September in the futures market jumped following the release of July payrolls and stand now at 89%. Powell explained in the Q&A following the last FOMC meeting that the majority view [around monetary policy] was still what it has been: "inflation is above target, maximum employment is at target, that means policy should be a little bit restrictive." Yet, two voting members felt that the time had already come. While we continue to expect the impact of tariffs on core goods inflation to build in the months ahead—a risk the Fed is likely aware of and shares—, July's employment figures have probably shifted its view of the labor market. Powell noted that if the Fed came to see the risks to its two goals as more balanced, policy should shift from

restrictive to neutral — somewhat lower than current levels¹. A growing share of voting members likely now see these risks as more balanced, making a September rate cut far more probable following the labor market shift.

Strong evidence of hiring freeze over the past three months
