

Real Estate Watch Second half 2009

– December 2009 –

- Global **economic perspectives are improving**, although uncertainty about the recovery is significant, especially in the developed economies
- The **adjustments** that the Spanish economy is facing condition its recovery in the short term. In 2010 there will be a significant improvement in comparison with 2009, although the economic activity will continue to shrink
- In the real estate sector, **residential activity shows great flexibility**, adjusting according to the sector need to reduce the housing overhang in the market. However, **non-residential activity**, supported mostly by public intervention, is yet to show significant signs of adjustment
- **House prices have not completed their adjustment process**: despite the slight improving signs observed during the summer months, the imbalance in the market is still significant. The cumulative adjustment **from peak should reach about -30% in real terms**
- **Residential remodeling** and growth originated in **other sectors** could act as support factors to the construction sector
- The evolution of **demographic variables** and some structural characteristics of the Spanish real estate market could imply a **potential housing demand of about 400,000 units per year**

Summary:

1. **Global economic perspectives are improving, although uncertainty about the recovery is significant, especially in the developed economies**
2. In Spain, pending imbalances and the need to reduce the leverage in some key sectors affect the beginning of the recovery
3. The real estate sector, despite the correction experienced so far, has not bottomed out yet and calls for further price adjustments
4. Residential remodeling and growth in other sectors of the economy could support the market in the short term
5. After the adjustment is completed, the estimated potential demand of about 400,000 units will support the market in the long term

Financial markets: progressive stabilization, but still dependent

Financial tensions have decreased substantially during the latest months

Source: BBVA ERD

First standardized principal component of the OIS spread, implicit volatility in the NYSE, banking CDS and corporate CDS

Nevertheless, the **evolution of the markets continues to depend greatly on massive injections of liquidity by central banks**

Financial markets: progressive stabilization, but still dependent

Bank and corporate risk premia continue to be stable since the summer,...

Summary:

- 1. Global economic perspectives are improving, although uncertainty about the recovery is significant, especially in the developed economies**
- 2. In Spain, pending imbalances and the need to reduce the leverage in some key sectors affect the beginning of the recovery**
- 3. The real estate sector, despite the correction experienced so far, has not bottomed out yet and calls for further price adjustments**
- 4. Residential remodeling and growth in other sectors of the economy could support the market in the short term**
- 5. After the adjustment is completed, the estimated potential demand of about 400,000 units will support the market in the long term**

Spain: a contraction in 2009 similar to the EMU

Net foreign demand and fiscal stimulus have compensated for the serious drop in Spanish domestic demand

Spain: a contraction in 2009 similar to the EMU

The **strong decline in imports** has resulted in a positive net contribution of foreign demand to the GDP,...

..., while the **fiscal stimulus**, considerably greater than in Europe, has contributed to a moderation of the decline in activity

Contribution of external sector to annual GDP growth (pp)

Fiscal measures (% GDP)

..., with a slow recovery in the short term ...

Spain: real GDP growth

..., as private consumption remains weak

Spain. Consumption (% y-o-y)

Source: BBVA ERD based on INE

Spain: Consumption (Quarter 0 =100)

Source: BBVA ERD based on INE data.

The weakness in private consumption and the slowdown in public consumption growth will condition the evolution of expenditure during 2010

Summary:

1. Global economic perspectives are improving, although uncertainty about the recovery is significant, especially in the developed economies
2. In Spain, pending imbalances and the need to reduce the leverage in some key sectors affect the beginning of the recovery
3. The real estate sector, despite the correction experienced so far, has not bottomed out yet and calls for further price adjustments
4. Residential remodeling and growth in other sectors of the economy could support the market in the short term
5. After the adjustment is completed, the estimated potential demand of about 400,000 units will support the market in the long term

The real estate sector, despite the correction experienced so far, has not bottomed out yet and calls for further price adjustments

The correction in residential investment has been so far the most relevant

The adjustment produced in the construction sector so far has been significant

The correction in residential investment has been so far the most relevant

Source: INE; BBVA ERD.

Spain: Distribution of the construction industry (%)

Source: SEOPAN.

The contraction in residential investment has been more pronounced than in the non-residential segment...

... as it was the sub-sector which grew the most during the latest expansionary phase

The correction in residential investment has been so far the most relevant

If compared with the previous real estate cycle, non-residential investment has barely adjusted

Source: BBVA ERD.

Source: BBVA ERD.

This behavior can partially be explained by the support provided by public intervention. However, on a private investment basis, the non-residential sector is contracting

The adjustment in the housing market in Spain has not bottomed out yet. Three important factors can help explaining why:

1

The stock of unsold houses is still significant

Spain: building permits, new homes
annual sums

Source: Ministry of Public Works, BBVA ERD.

Supply of new homes has shown significant flexibility, reaching quickly minimum historical levels

Spain: Housing over supply estimation

Source: SEE BBVA

This has helped slowing down the accumulation of oversupply in the market, that in any case is still significant, and pushes house prices down.

The adjustment in the housing market in Spain has not bottomed out yet. Three important factors can help explaining why:

2

In comparison with other cycles, house prices have not declined sufficiently

Spain: real house price cycles

Source: Ministry of Housing; BBVA ERD.

During this cycle, real house prices declined about 10% from peak, less than observed during the cycle of the nineties.

Spain: real house prices

Source: Ministry of Housing; BBVA ERD.

According to our estimates, the total adjustment from peak should reach a cumulative decline of about 30%

The adjustment in the housing market in Spain has not bottomed out yet. Three important factors can help explaining why:

3

In terms of income, affordability has not improved significantly

Spain: Housing affordability
Price/Income ratio

Source: BBVA ERD.

Spain: Housing affordability
Tax-adjusted purchase effort as a % of household income

Source: BBVA ERD.

Without taking into account the interest rate decline, the improvement in the affordability ratio has been modest. Besides, given the negative confidence environment, housing demand has not recovered yet.

The deterioration in construction activity in Spain is materializing in a significant decline in labor demand from the sector

...which actually produced an intense employment reduction

Spain: GDP, construction and housing (% y/y)

Source: INE; BBVA ERD.

Spain: Cumulative employment growth
(1000 = 100)

Source: INE; BBVA ERD.

The deterioration in construction activity in Spain is materializing in a significant decline in labor demand from the sector

..., but not a moderation in wages

Source: Eurostat (ICLA); BBVA ERD.

The deterioration in construction activity in Spain is materializing in a significant decline in labor demand from the sector

Only Ireland shows a comparable job destruction to Spain during the current cycle...

..., however, only in Spain wages responded with some lag with respect to the deterioration of the sector

Source: Eurostat (ICLA); BBVA ERD.

Source: Eurostat; BBVA ERD.

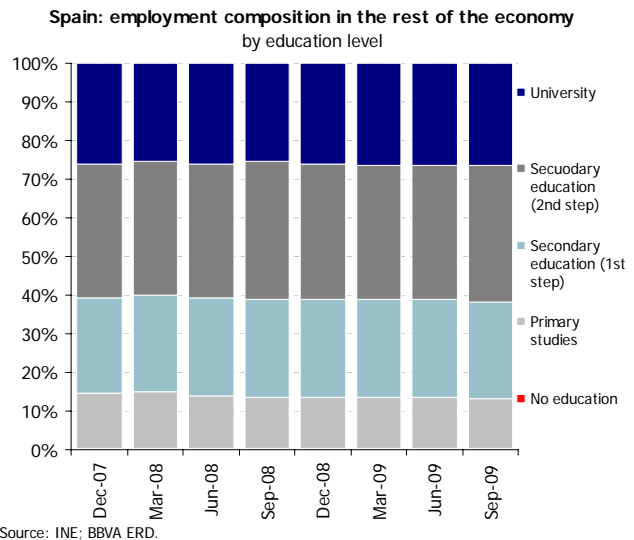

The deterioration in construction activity in Spain is materializing in a significant decline in labor demand from the sector

Wage stickiness, and especially the change in the **composition of workers in the construction sector** – due to low productivity and worse remunerated job losses- are the main factors accountable for the **recent salary dynamics**

The deterioration in construction activity in Spain is materializing in a significant decline in labor demand from the sector

The weight of construction workers with secondary and university studies rose 4.8 pp from the end of 2007 reaching 40.8% in the 3Q of 2009, with respect to an increase of only 1.2 pp in the rest of the economy

The deterioration in construction activity in Spain is materializing in a significant decline in labor demand from the sector

The temporary rate for employment in the construction sector declined significantly more (-9.3 pp) than in the rest of the economy (-3.0 pp)

Average seniority of workers in the construction industry rose about 25.3% between the 4Q07 and the 3Q08, reaching an average of 7.2 years. The increase in the rest of the economy was much more contained (5.3%)

Source: INE; BBVA ERD.

Source: INE; BBVA ERD.

Summary:

1. Global economic perspectives are improving, although uncertainty about the recovery is significant, especially in the developed economies
2. In Spain, pending imbalances and the need to reduce the leverage in some key sectors affect the beginning of the recovery
3. The real estate sector, despite the correction experienced so far, has not bottomed out yet and calls for further price adjustments
4. Residential remodeling and growth in other sectors of the economy could support the market in the short term
5. After the adjustment is completed, the estimated potential demand of about 400,000 units will support the market in the long term

Building remodeling activity could help the sector recovery in the future

Spain: building permits
(% y/y quarterly moving average)

Source: Ministry of Public Works; BBVA ERD.

Spain: remodeling and expansion permis
(% y/y quarterly moving average)

Source: Ministry of Public Works; BBVA ERD.

Although the adjustment in construction activity deepened, remodeling works are reacting positively

The positive evolution in remodeling activity will contribute to a more “sustainable” transformation of the real estate sector also aided by government policies

➤ **HOUSING AND REDEVELOPMENT PLAN 2009-2012:** it aims on the one hand to rehabilitate urban centres and rural areas; on the hand, it promotes housing energy efficiency

Measures: protected loans; loan subsidies

➤ **BILL FOR A SUSTAINABLE ECONOMY:** support building remodeling activity in accordance with the sustainability of the economy

Measures:

- New tax relief for works aimed at improving energy efficiency (10%)
- Reduced VAT for works that reduce energy consumption, water and improve accessibility

Rehabilitation and remodeling activity combine intense use of labor with low environmental impact

Given the relevance of the dragging effects of the sector towards other industries, the correction experienced so far is having relatively high impact on the rest of the economy

The analysis of these effects detects some **homogeneity** with regards to the **magnitude** of the effects the construction industry has towards the production activity in the remaining sectors of the economy...

Effects on GVA in each economy of 1 million c.u. decrease in final demand for each industry. Domestic I-O Tables

Source: BBVA ERD based on OECD

Effects on employment in each economy of 1 million c.u. decrease in final demand for each industry. Domestic I-O Tables

Source: BBVA ERD based on OECD

Given the relevance of the dragging effects of the sector towards other industries, the correction experienced so far is having relatively high impact on the rest of the economy

..., as well as towards the **type** of sectors affected

Construction. Backward linkages (main sectors)

Source: BBVA ERD

Given the relevance of the dragging effects of the sector towards other industries, the correction experienced so far is having relatively high impact on the rest of the economy

The measurement of the ability of each sector to benefit from an increase in demand suggests that the **construction sector will be amongst those that will benefit the most** from a future upturn in demand

Characterization of each sector according to its backward and forward linkages. Rasmussen indices

Source: BBVA ERD

Summary:

1. Global economic perspectives are improving, although uncertainty about the recovery is significant, especially in the developed economies
2. In Spain, pending imbalances and the need to reduce the leverage in some key sectors affect the beginning of the recovery
3. The real estate sector, despite the correction experienced so far, has not bottomed out yet and calls for further price adjustments
4. Residential remodeling and growth in other sectors of the economy could support the market in the short term
5. After the adjustment is completed, the estimated potential demand of about 400,000 units will support the market in the long term

Population growth peaked in 2008 and the outlook for the future shows a significantly more contained growth

Source: INE.

Among the main demographic factors that affect population growth, the revision in migration flows has been the most negative, thus contributing to lower future housing demand

Source: INE.

Source: INE.

From an average of about 700,000 immigrants a year between 2001-2008, the new forecasts point towards an average of about 360,000 between 2009-2016

However, **household size reduction**, towards European levels, will generate about 280.000 household a year

Spain: average household size
(n. of individuals)

Source: INE; Eurostat; BBVA ERD.

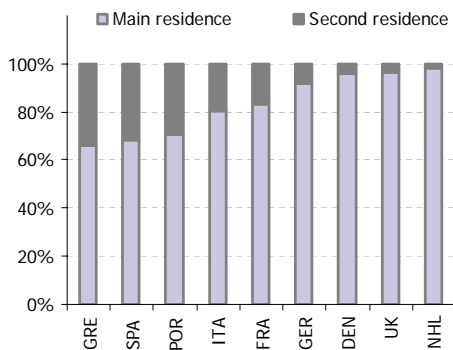

Spain: household formation
(averages)

Source: BBVA ERD.

Moreover, demand for **second homes**, even if reduced, will continue to exist in the future. Taken altogether, potential housing demand could reach about **400.000 units a year** once the market returns to **normality**

Percentage of second-residence homes
