Balance of Payments 2010: moderate Current Account deficit and strong portfolio investment inflows

Economic Analysis

Balance of Payments 2010

Pedro Uriz
pedro.uriz2@bbva.bancomer.com

- In 2010, the current account deficit was moderate, 5,690 MD (0.5% of GDP)
- This was the result of deficits in the trade balance (-\$3,121m), non-factor ¹ (-\$9,610m) and factor ² (-\$14,773m) services, and a surplus in the balance of transfers (\$21,504m).
- The capital account had a surplus of \$36,017m (3.5% of GDP), which makes it easy to finance the small current account deficit.

The foreign sector was very dynamic in 2010. The exchange of goods and services picked up thanks to the recovery of a large part of the world economy, particularly the US, which resulted in a revival of the sectors linked to Mexico's manufacturing industry. Moreover, the continuity of expansive monetary policies like the second round of quantitative easing in the US generated significant portfolio investment flows in emerging countries, and Mexico was no exception.

The current account closed 2010 with a deficit of -0.5% of GDP, which was lower than the one recorded in 2009 (-0.6%). Although similar, both figures are a result of different dynamics. In 2009 there was a strong decline in world trade, causing in our country a reduction in imports (-23.2% y/y) which was sharper than the fall in exports (-19.5% y/y), thus reducing the deficit. By contrast, in 2010 the recovery of exports (29.8% y/y), primarily manufacturing (29.1% y/y) and oil (34.8% y/y), was stronger than the upturn in imports (28.6% y/y), where those linked to domestic demand, consumer goods imports (26.2% y/y) and capital (-1.3% y/y) took longer to recover, which kept the deficit in check.

The capital account recorded net inflows of €36,017m, 91% more than in 2009. Direct foreign investment grew by 16.6%, but failed to recover the pre-crisis levels. Portfolio investment recorded spectacular growth, reaching record inflows of €23,769m. This is the result of money flowing into the market thanks to the expansive monetary policies implemented in developed countries, which encouraged investors to seek higher yields out of those countries, and which in Mexico was boosted by the inclusion of the Federal Government's long-term bonds in the WGBI index, increasing investor confidence. Finally, the Bank of Mexico accumulated reserves of €22,759m, thanks to the increase in exports –primarily oil– and the activation of the option sale mechanism for selling dollars to the Central Bank.

Conclusion: the performance of the balance of payments in 2010 was a result of many temporary factors which reveal a yet incomplete normalization of the world economy. However, insofar as such normalization materializes, the current account deficit will tend to increase, a result which is more consistent with Mexico's production structure during expansion phases.

¹ Non-factor services are those related to travelers, tourists and transport.

² Factor services are those related to payment of interest for debts incurred abroad.
