**Economic Analysis**

Francisco Javier Morales E.  
fj.morales@bbva.bancomer.com

## Bank Credit: Monthly Situation Report

- In January 2011, the nominal annual rate of growth of the current credit portfolio from commercial banks to the private sector was 9.1%.
- Corporate credit presented the most growth (10.4% nominal), followed by consumer (8.8%) and mortgage (8%).
- The favorable macroeconomic climate of investment, employment and GDP growth together result in the increase of lending to the private sector as these factors boost the growth of its demand.

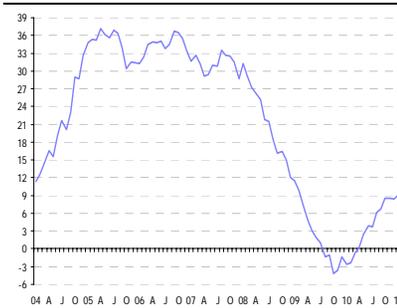

**Total outstanding credit to the private sector**

In January 2011, the nominal annual growth in outstanding bank lending to the private sector was 9.1%. This rate was higher than for the preceding month (8.4%) and for the same month in 2009 (-2.6%). Chart 1 indicates that since April 2010, the nominal growth of total lending to the private sector has once again become positive. Lending to the private sector will continue on the rise as a result of the boost received from employment and GDP growth. These factors preserve and even increase the payment capacity of families and businesses and, furthermore, increase the demand for lending in a favorable macroeconomic climate.

**Corporate Credit**

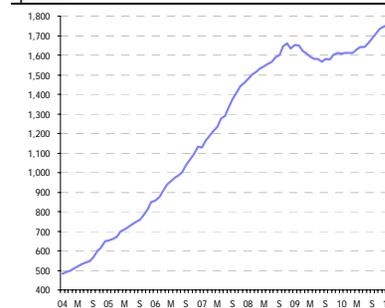

In January 2011, the nominal annual rate of growth for corporate credit was 10.4%. This rate was higher than the preceding month (8.9%) and than the same month in 2010 (-1.3%). The delayed effect of the 2009 recession affected the progress of this credit in the first quarter of 2010. Once the economy began to grow again, so did corporate credit. Another important factor boosting bank credit to businesses, in addition to GDP, is gross fixed investment. In this regard, as these two variables grow at high, sustained rates, corporate credit will also increase since their demand will also be on the rise.

**Residential Mortgage Lending**

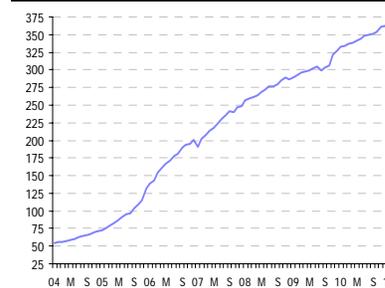

In January 2011, nominal annual mortgage lending growth was 8%. Growth registered in the preceding month (10.6%) was higher, as was the case in the same month of 2010 (14.6%). In November 2009, the current loan portfolio in residential mortgage lending held in investment units (UDIs) was transferred to the current peso portfolio. Thus, from October to November 2009, the annual growth rate for mortgage lending increased. Banxico data indicates that from December 2010 to January 2011, the balance of current mortgage lending fell so much that the portfolio held in UDIs grew. This could be a transfer of the loan portfolio that reduced the mortgage lending growth rate in pesos.

**Consumer finance**

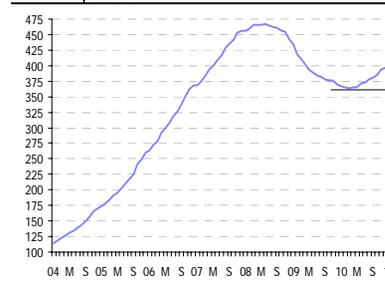

In January 2011, the rate of nominal annual consumer finance growth was 8.8%. That rate was higher than that of the preceding month (7.1%) and of the same month in 2009 (-15.5%). As can be observed in Charts 10 and 11, consumer finance is in a clear process of recovery after eliminating the adverse effects of the 2009 recession. The growth of GDP and employment have been the factors that have boosted its recovery. In this regard, as these two macroeconomic variables continue to grow, so will consumer finance.

**Bank Lending: Contribution to growth by components**

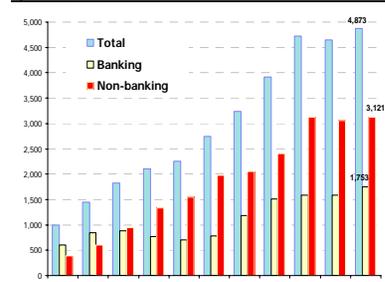

The breakdown by components of the 9.1% total growth in bank lending to the private sector in January 2011 was as follows: corporate lending contributed 5.5 percentage points (pp) of the 9.1 pp of total lending growth; consumer finance contributed 2.0 pp; and mortgage lending contributed 1.7 pp. Furthermore, lending to non-bank financial intermediaries (NBFIs, which only represents approximately 3% of total lending) had a negative contribution of -0.1 pp.
